Critical discourse analysis and the challenge of social media: the case of news texts

Gwen Bouvier and David Machin

Gwen Bouvier

Gwen Bouvier is Senior Lecturer at Orebro University, Sweden. Her main areas of research interest are social media, discourse, and news and her publications have drawn on multimodal and discourse analysis. Her latest publications include Bouvier, G. (ed) (2016) *Discourse and Social Media*, London: Routledge; Bouvier, G. (2015) 'What is a Discourse Approach to Twitter, Facebook YouTube and other Social Media: connecting with other academic fields', *Journal of Multicultural Discourses*, 10(2): 149-162.

David Machin

David Machin is Professor of Media and Communication at Orebro University Sweden. He has published widely in the areas of Critical Discourse Analysis and Visual Communication. His publications include *How to Do Critical Discourse Analysis: A Multimodal Introduction* (2012), *The Language of Crime and Deviance* (2012) and *Visual Journalism* (2015). He is co-editor of the international peer reviewed journals *Journal of Language and Politics* and *Social Semiotics*.

Abstract

CDA is a particular strand of discourse analysis which has been interested in the role of language in the functioning of society and political processes. It has tended to target texts produced by elites and powerful institutions, such as news and political speeches, with a view to revealing the kinds of discourses used to maintain power and sustain existing social relations. However, since the internet and social media have come to define much of the way that we communicate and run our lives it has become clear that CDA should engage more with language and discourse in this context. Looking at how CDA approaches news texts, we show that social media bring a number of challenges as regards how we formulate the relationship between texts and ideology, and how we view the relationship between the author and reader. This creates a challenge for how we collect data and the very methods we need to carry out analysis.

4
5

6 **Introduction**
7

8
9 CDA is a particular strand of discourse analysis which has been interested in the role of language in
10 the functioning of society and political processes. Emerging out of Critical Linguistics in the late
11 1970s, CDA saw “language as a form of social practice” (Fairclough, 1989: 20), which is used to
12 legitimize, maintain and naturalize forms of social power and inequality. Here power means the
13 ability not only to coerce through things like the military, legal or penal system, but where there is
14 control over the kinds of ideas and values used to create our societies. These will be found
15 throughout institutions and organizations such as schools, businesses and media (Simpson & Mayr,
16 2010: 2). The language and communication found in, and produced by, these institutions and
17 organizations will reflect the interests of those in power and in a sense will create a kind of ‘consent’
18 that they are common sense and best for all interests. CDA is therefore interested in close analysis of
19 how language plays a role in creating and sustaining these dominant interests, for example, as
20 regards class relations, racism and sexism, with the ultimate aim of resisting social inequality (Van
21 Dijk, 1998: 1).

38 In CDA, analysis has tended to target texts produced by elites and powerful institutions, such as news
39 and political speeches, with a view to revealing the kinds of discourses used to maintain power and
40 sustain existing social relations. However, since the internet and social media have come to define
41 much of the way that we communicate and run our lives (Thurlow, 2011), there have been obvious
42 calls that CDA engage more with language and discourse in this context (Bouvier, 2015). Social media
43 have also become integrated with the way that official institutions and organizations now operate,
44 since it is also here that social and political issues are represented and debated (Mautner, 2005). But
45 whereas former ‘elite’ texts appeared to provide clearer routes to tracing dominant ideologies, social
46 media mix voices and genres of communication, and these are shifting combinations of interactions
47 within and across platforms, often which feed into more traditional media forms (KhosraviNik &

1
2
3 Unger, 2015). This creates new theoretical and methodological challenges for CDA. News itself has
4
5 become highly integrated into social media, both as a way of sourcing and delivering content. The
6
7 route to identifying and understanding elite ideologies has changed. This has resulted in texts that
8
9 are certainly less static, which look very different, and which are generated and received in very
10
11 different ways. And, we show, news sits in a broader media landscape where flows of knowledge
12
13 must be characterized in very different ways, where authorship and authority in texts needs to be
14
15 rethought. In this paper, we identify the nature of these challenges as regards the way that CDA
16
17 approaches news texts, both as regards how we can characterize them as vehicles of ideology and in
18
19 terms of how they should be approached as data.
20
21

22 23 **Doing Critical Discourse Analysis**

24
25 There are different ways of doing CDA and these involve a range of different and overlapping
26
27 concepts (Wodak & Meyer, 2001). But put in simple terms, CDA is problem, not theory driven, where
28
29 the aim is to analyze language use to show “strategies of manipulation, legitimation, the
30
31 manufacture of consent, and other discursive ways to influence the minds (and indirectly the actions)
32
33 of people in the interests of the powerful” (Van Dijk, 1995: 18).
34
35

36
37 In CDA it is assumed that those in positions of power will attempt to disseminate discourses
38
39 (Foucault, 1972) throughout society that serve their own interests. Discourses are like models of the
40
41 world that explain why we do things, how we understand events and processes, what kind of people
42
43 exist in the world (Fairclough, 1992). Such discourses can be found by looking at more subtle uses in
44
45 language. For example, it has been shown that in news reports reported speech can carry non-
46
47 explicit meaning (Caldas-Coulthard, 1994). For example:
48
49

50
51 *The management stated that working conditions were of the highest standard*

52
53
54 *The workers claimed there were problems with working conditions*
55
56
57
58
59
60

1
2
3 The difference between 'stated' and 'claimed' here implicitly affirms the stance of the management
4
5 as more credible than the workers, who make mere claims. Such smaller uses of language can build
6
7 up in a text, for example, to reinforce a well-trodden discourse that trade unions are self-motivated,
8
9 against the wider interests of society.
10

11
12 For CDA, therefore, the aim is to critically study the language found in texts to reveal the kinds of
13
14 discourses being disseminated. At a surface level, Fairclough (2001: 27) points out, these may appear
15
16 as "universal and commonsensical [yet] can often be shown to originate in the dominant class".
17
18 While CDA tends to argue that society is complex and has many different kinds of power relations
19
20 between groups, for example men and women and between ethnic groups (Fairclough, 2001), as van
21
22 Dijk (1995: 250) points out the focus has been on "elites and their discursive strategies for the
23
24 maintenance of inequality". And importantly, one massive resource for the maintenance of power is
25
26 having "privileged access to discourse and communication" (Van Dijk, 1993: 255).
27
28

29
30 Importantly for CDA, discourses are interconnected with social practices. Social practices are the
31
32 doings of discourse (Fairclough, 2000). Discourses provide the 'scripts' for acting in society, and in
33
34 turn social practices embody discourse in the material world that we meet.
35
36

37
38 While people may encounter dominant discourse through mundane everyday situations such as
39
40 through chatting over coffee, the focus of CDA has been the major institutions such as the news
41
42 media which are the major channels for such views, where elites transfer their discourse to lower
43
44 classes (Van Dijk, 2008). While such major news institutions still have importance, social media have
45
46 changed the way that information and knowledge are exchanged in society. They have changed the
47
48 routes and patterns by which this is done, created shifts in the genres and discourses through which
49
50 this takes place, and importantly have changed the nature of authorship itself. All of these require
51
52 that CDA reconsiders how elites can directly control discourse and if this now becomes of a different
53
54 order, requiring new models and new tools for analysis.
55
56

57 **Text analysis in the context of production and reception**
58
59
60

1
2
3 CDA is clearly based on a number of assumptions about the nature of ideology found in texts and the
4 value of studying the discourses disseminated by elites of powerful groups by major institutions.
5
6
7 News organizations in this sense have logically been key sites for the study of language and
8
9 communication. However, since the mid-2000s in particular, the media landscape has transformed.
10
11 While we still find many of the former top-down monolithic media intact, these sit alongside and are
12
13 integrated with newer forms of media that involve different kinds of channels of content flow and
14
15 different kinds of 'producer-receiver' interactions (KhosraviNik & Unger, 2015). The challenge for
16
17 CDA is to grasp what this means as regards carrying out critical language analysis, to reveal how
18
19 dominant ideologies are disseminated in a society.
20
21

22
23 In fact, over many years CDA has been criticised for being overtly text focussed, and for failing to
24
25 account for processes of production and reception (Philo, 2007). In practice this has meant that the
26
27 nature of discourses found in texts through linguistic analysis are rather simplistically understood.
28
29 While a number of key authors in CDA have called for the inclusion of these as part of the process of
30
31 analysis (Fairclough, 2000) this has never really materialised. As a first step to looking at the
32
33 challenges for CDA as regards social media, we begin by asking what former challenges have not so
34
35 well been taken up. While social media bring new challenges, they follow some of these earlier
36
37 patterns.
38
39

40
41 A CDA approach to a news text that represented an industrial dispute may be able to show that
42
43 reports always subtly favour management against workers. However, the ideology found in such
44
45 texts may not be so much the 'bias' or ideology of an individual journalist or news outlet per se.
46
47 Much news content comes from four major global news agencies that are linked into financial
48
49 markets and corporate networks (McChesney, 2004). These agencies produce stories aimed at and
50
51 packaged for their major customers; for the most part media corporations in wealthier Western
52
53 societies. The bulk of the income of these agencies comes from delivery of data for financial markets
54
55 (Loomis, 2007). Studies of the output of these news agencies show that they tend to select and
56
57
58
59
60

1
2
3 produce stories based around a limited set of values targeted at their main western markets (Harcup
4 & O' Neill, 2010). In other words, what events are easily meaningful and unambiguous for those
5 news audiences? As we will show shortly, such 'news values' later become integrated into the way
6 social media identify things like 'trending topics'.
7
8
9

10
11
12 It has also been shown that up to 70% of what appears as news is produced by PR companies, who
13 supply ready to use stories and scripts for broadcasters (Lewis *et al*, 2008). Further, much news is
14 sourced from official institutions, such as the police, courts and local-authorities (Fishman, 1980).
15
16 This has the advantage for news outlets that they provide regular and predicible sources of events
17 that can be presented as newsworthy. But it means that the news is basically an official view of the
18 world. For example, crime is seen from the point of view of law enforcement rather than those who
19 inhabit the socially deprived areas where it tends to take place (Mayr & Machin, 2012). As we look
20 to how social media provides sourcing for news, we also have to ask what kinds of organisations will
21 tend to be supplying content.
22
23
24
25
26
27
28
29
30

31
32 Critics of CDA have argued that challenging power relations through drawing out ideologies in news
33 texts can be rather simplistic without understanding how what we find in those texts is a result of
34 these kinds of processes. An analysis carried out in CDA that looks at language alone is unlikely to
35 throw any deeper insights into how ideology is disseminated (Philo, 2007). In fact, as Philo argues,
36 such a text analysis should be done as part of a production study, showing how journalists write, how
37 they compose for different markets, for multiple readerships, using particular sources for practical
38 and economic reasons (2007: 192). In one sense here, ideology is built into the nature of news per se
39 and the processes that lie behind the text itself.
40
41
42
43
44
45
46
47
48

49
50 Put another way, the critical study of language may involve documenting the use of language. But it
51 also means studying how it is used in specific contexts, with a view to revealing who has control over
52 it and how this control is exercised. Since the rise of social media, however, while these production
53
54
55
56
57
58
59
60

1
2
3 factors still apply, there are some additional challenges to take account of. To some extent these
4
5 transform production, reception and the genres of communication that are involved.
6
7

8 **How social media has changed news**

9
10 Over the past decade we have seen the huge changes in the media landscape where social media
11 and the internet allow citizens, civic society, politicians and business elites to bypass traditional mass
12 media and directly communicate with each other (Paulussen & Harder, 2014: 543). The demand of
13 the internet-based media environment, with the need for constant updates and massive competition
14 for clicks, has also created a further challenge for many long-established traditions in journalism and
15 news production, leading also to the need for radically different business models (Picard, 2014: 273).
16 Journalists now work in an environment where there are blurring boundaries between citizen
17 journalists, bloggers, and other communication roles (Carlson & Lewis, 2015). All these factors
18 suggest new relationships between producers and readers. They also mean new production
19 processes to grasp in order to understand the social goings on behind news texts. In both cases,
20 there are implications for how we attribute discourses and ideology in texts.

29
30
31
32
33
34

35 **Social media and the sourcing of news**

36
37 Social media itself has become a core part of sourcing news content (Hermida, 2012). This can mean
38 breaking stories by using citizen journalist reports on Twitter, or having journalists scouring local
39 community networks on social media for locally trending story ideas. This has been one way to
40 engage audiences in an environment where there has been a massive decline in interests in
41 mainstream news (Picard, 2014). Job vacancies at local news outlets often include things like 'social
42 media journalist' or 'engagement journalist'. At the time of writing, Twitter itself had become what
43 some observers called a part of news production's "technological infrastructure", where news outlets
44 find stories but also where they monitor and copy each other (Paulussen & Harder, 2014: 543). Here
45 we may find the views of the elite sourced particularly from Twitter. But we may also find local and
46 non-elite material.
47
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 There were celebratory accounts of the use of Twitter to break and source stories, for example in the
4 coverage of earthquakes and uprisings (see Bruno, 2011; Newman, 2009), arguing that Twitter users
5 function as a kind of early warning system that can then be followed up by professional journalists
6 (Bruno, 2014), what Allan (2013) calls 'citizen witnessing'. Citizen generated content can be used, it
7 has been argued, as a form of "liberation technology" (Diamond, 2010: 70), where governments,
8 election processes, police actions and so on can be monitored. Such observations, from the point of
9 view of CDA, suggests a shift away from the manner in which elites may be able to more directly
10 control discourse. For example, where crime can become less defined by law enforcement
11 organizations, and where social media carries footage and viewpoints from those experiencing
12 events, as we have seen with events of police violence against black citizens in the US. Indeed, if the
13 news media engage more with the stories and events running across social media, does this mean
14 that this sense of top-down ideology becomes less of a straightforward idea? At least the task may
15 be more to look at how 'citizen' viewpoints become re-contextualized as they become news.

56
57
58
59
60
Others journalism scholars pointed out that most citizen generated content was simply absorbed into
the typical kinds of news values and frames used by mainstream outlets (Allen, 2006). So a citizen
generated photograph from a war zone is used by a news website not in a way that helps to provide
context specific information to that situation, but simply as part of the usual news frames employed
for such conflicts in remote places. For example, it has been observed that conflict images often
depict children as part of signifying societal breakdown and to chime with western readers (Parry,
2012).

In such cases, social media viewpoints become simply shaped to fit the traditional forms of stories
supplied by the news agencies. Keller (2011) points to how such citizen reporting can simply have a
legitimizing effect on mainstream news presentations. Social media-generated news out of a conflict
area signifies on-the-spot immediacy, even if no attempt is made to provide any further context. And
it allows the news to give a sense of presenting the voice of the ordinary person, bringing a freshness

1
2
3 to stale formats (Anden-Papadopoulos & Pantti, 2011), or to show that it has become, like the rest of
4
5 the media landscape, more democratised. Here the citizen voice does not challenge the top-down
6
7 elite discourses, but is used a resource to further legitimize them.
8
9

10 For a researcher seeking to carry out CDA, a single news text about a conflict in remote place may
11
12 contain elements of citizen journalism, some eyewitness comments about the brutality of the
13
14 regime's police, an image of a marketplace after an explosion taken by a mobile phone. In the case
15
16 of such a text, what is it about production that we need to know in order to avoid the kind of
17
18 simplistic analysis that lead to the likes of Fairclough (1995) urging that CDA must grasp something of
19
20 the social goings on behind texts? In this case, we may have some of the former top-down
21
22 processes, as found in the earlier media landscape. So the texts are result of the work of news
23
24 agencies, are advertising driven, and we find a dominance of elite sources. Ideology here therefore is
25
26 built into news at a systemic level. But here social media introduces other elements that themselves
27
28 remain to be assessed and understood. Clearly for CDA, in this environment of increased diversity of
29
30 sources one aim would be to identify where and if there is space for competing discourses and what
31
32 these are. If we find a massive increase in citizen reports, sourced from social media, to what kinds
33
34 of social practices are these related? Are there spaces here where grassroots views are permitted,
35
36 for example in crime and policing, where police brutality against black citizens in the US has be
37
38 highlighted through social media, but other areas where it is excluded?
39
40
41
42

43 **Social media and how we access news**

44
45

46 Social media have transformed the delivery of news, becoming one of the main sites where readers
47
48 access news and where outlets can deliver tailored content to personal needs (Mortimer, 2014).
49
50 Since the 1990s it was observed that news delivery became much more focussed on niche market
51
52 groups, which were of high value to advertisers (Harcup, 2015). Individual journalists began to be
53
54 trained in how to write in ways that addressed such niche markets, marking a shift away from
55
56 audiences being addressed as citizens to them being addressed in the first place as consumers
57
58
59
60

1
2
3 (Machin & Niblock, 2006). But in the social media environment this targeting of news content to
4
5 consumer preferences shifts to a new level as stories are delivered to customers driven by data
6
7 analytics. Now news organisations constantly monitor traffic via web analytics. Patterns of reading
8
9 are traced and modelled and resources then shifted to productive areas (Linford, 2015). Such
10
11 patterns are then used to process complex data to profile news consumption with consumer
12
13 behaviour.
14

15
16 The links between social media platforms and other kinds of sites in this situation, it has been
17
18 argued, becomes a matter of corporations looking to lock users into their own chain of platforms in
19
20 order ultimately to deliver to advertisers (Van Dijck, 2013). This may include email, news-
21
22 agglomeration-sites, tablet-interfaces, platforms for television and movie delivery, and other social
23
24 media. Here news organisations will need to ensure that they are favoured by the kinds of
25
26 algorithms used at any time by dominant social media platforms, such as Facebook. Even here it has
27
28 been argued that algorithms themselves become the shapers of discourse, or social relations
29
30 (Bouvier, 2015). In other words, the discourses presented to any individual through news,
31
32 entertainment, and other things 'you may also like', are patterned in ways aligned to your previous
33
34 online activities, which include consumer behaviour (Doctor, 2010).
35
36

37
38 But what does this mean as regards power over discourses? In this sense the news reader, clicking
39
40 on an item signalled as 'you might also like', may have more choice. They may have escaped the top
41
42 down, distant, elite voice of the news reader delivering a bulletin to a whole country at a set time.
43
44 But according to the likes of Dean (2010) these social media platforms and networks of
45
46 communication are about capturing us into patterns of consumption. Social media in this sense, we
47
48 might argue, offers "a confined and controlled space for semi-public interactions, under the
49
50 conditions of a commercial logic" (Hintz, 2016: 327). Media and Communications scholars have long
51
52 documented and expressed concern over the influence of advertising over news content (Curran &
53
54 Seaton, 2010), but this is different. It has been argued in CDA that processes of marketization,
55
56
57
58
59
60

1
2
3 especially since the 1990s, have been penetrating deeper into all parts of society, even those parts
4 normally operated along completely different principles such as our major public institutions
5 (Fairclough, 1992). News, in the social media environment, must also be thought about not in terms
6 of a site for civic public debate dominated by elites, but as something fundamentally organized and
7 created based on marketization and commodification.
8
9
10
11
12

13 **Social media and the decline of the authority of the text**

14
15
16
17 With the rise of social media, it has been argued that the relationship between the public and media
18 has changed (Murthy, 2010). In the pre-social media era highly centralized and monolithic media
19 such as national newspapers were consumed in a top-down fashion by the public (Gilmor, 2006).
20 Such media provided highly influential focal points for civic debate within any society, and news
21 wielded much power over discourse. This, along with other powerful state institutions such as
22 schools and politics, provided, or exerted, a powerful sense of collective culture and of what was
23 shared knowledge about the world (Beck 1996). Here, for CDA, the analysis of texts can be one way
24 to access how such collective culture is defined in this top-down fashion.
25
26
27
28
29
30
31
32
33
34

35 But scholars point to major shifts away from centralised state power with a decline in the influence
36 of the older institutions to govern and regulate society (Beck, 1996). There has been a process of
37 devolving those roles taken by former state institutions to private and semi-private organisations
38 (Jessop, 2007). The major state institutions that wielded the power of the old centralized state,
39 including political institutions and the news media, fall into decline and lose their former powers
40 (Beck, 1996). Here too, we find a decline in the power of the elites and professions who controlled
41 those institutions (Freidson, 2001).
42
43
44
45
46
47
48
49
50

51 Such societal shifts have led to what Zizek (1997) called a collapse of the 'big other'. By this he
52 meant the loss of any centralized, dominant form of institutionalised knowledge, which provided a
53 sense of consensus about ideas and identities. Dean (2010:5) argues that this decline of a central
54 'symbolic' has been replaced by the niched yet fragmented and overlapping patterns of connectivity
55
56
57
58
59
60

1
2
3 created by social media, comprised of bundles of entertainments, consumerism and more localised
4
5 interests. The former top-down sense of collective culture providing authoritative and consensual
6
7 knowledge thus has become replaced by diverse and fragmented user opinions on social media
8
9 platforms like Twitter, Facebook, etc. News ceases to provide the central symbolic but now looks to
10
11 engage interest of individual users who operate within communities of connectivity. As previously
12
13 mentioned, recruitment listings in the news industry began to call not for 'reporters' but for
14
15 'engagement journalists'.
16

17
18 In this new context, news simply cannot offer itself to readers through the same kind of voice of
19
20 authority as in a former era, something acknowledged by news editors (Machin & Polzer, 2015).
21
22 Readers expect to be engaged in a level way, already as knowers and as having specific interests and
23
24 ways of viewing the world. This is simply how news readers in the social media environment expect
25
26 to be engaged. Here in fact, the very ideas of 'readership' and 'authorship' themselves become
27
28 unstable. As Kress (2005: 19) points out "When everyone can be an author, authority is severely
29
30 challenged". The very nature of communication which gave the author power, established over
31
32 several centuries, has simply changed as has the authority vested in the author. For Kress, in
33
34 particular this demise in the power of the author means that what is produced in texts is no longer
35
36 seen as 'knowledge' in a former sense but rather as information and, as Dean (2010) argues, is
37
38 mostly treated as opinion rather than fact. This has implications for how 'news' can be presented to
39
40 a reader. A click-bait headline appearing in the new column of your social media page does not claim
41
42 the weight of formal authority, but as 'something else you might like'. And in terms of authorship,
43
44 the news item is no longer read as part of a former media genre, the newspaper, where authorship is
45
46 provided by the name '*The New York Times*', which occupies a huge city center building. The user
47
48 will have less interest in the 'authorship' as in whether indeed it fits with their realm of information
49
50 needs.
51
52
53
54
55
56
57
58
59
60

1
2
3 Kress (2005: 10) argues that now readers fashion knowledge themselves, using information supplied
4
5 in texts where there is a culture of using such information in relation to solving immediate problems,
6
7 fulfilling needs, or requirements. News formerly carried authority, providing a top-down sense of
8
9 shared knowledge and culture. It was the voice of the Zizek's 'big other'. But this would no longer be
10
11 acceptable to readers who need to be addressed as equal authors, as holders of opinions.
12

13
14 This decline of the 'big other', of the monolithic media, and a sense of monolithic audiences,
15
16 presents new challenges to CDA as regards how the dissemination of ideology can be accounted for.
17
18 But so too does it ask for new ways of thinking about readership. Readers gain power in a sense as
19
20 they are addressed as individual users with information needs. And as authorship ceases to hold
21
22 power 'big knowledge' itself declines. For CDA, here the challenge comes to look at the kinds of
23
24 discourses and ideologies that are carried across these communities of opinion, and to understand
25
26 more about what this means as regards how dominant discourses become disseminated and shaped
27
28 within these. This brings us onto our next section.
29
30

31 32 **Reading ideology in texts** 33

34
35 One other major criticism of the way that CDA deals with news texts and ideology that we have not
36
37 yet addressed, is that it has paid little attention to how news audiences deal with news discourses
38
39 (Philo, 2007). As such, it could be argued that what CDA produces is little more than a scholarly
40
41 reading of a news text (Widdowson, 1995). Here, social media offer a range of possibilities, yet again
42
43 the challenge is how we approach these.
44
45

46
47 Communications scholars have argued that one central question to answer as regards news is how
48
49 audiences relate to the discourses produced by journalists (Hall, 1986). If we want to understand
50
51 and challenge dominant ideologies and the social relations that they produce, we must investigate
52
53 the ways in which different people in society relate to these. Fairclough (1989: 28) himself notes that
54
55 power relations in a society are always part of a 'struggle'. But it could be argued that CDA tends to
56
57
58
59
60

1
2
3 tell us little about this struggle, given its focus on elite texts. And it has been argued therefore that
4
5 complexities in discourses have tended to be overlooked (Philo, 2007).
6

7
8 Media and communications scholars have long argued that how we engage with things like news is
9
10 complex, may be fragmented and fleeting, and has always been difficult to research (Silverstone,
11
12 1994). Audience studies involving questionnaires or focus groups tend to produce artificial data
13
14 where people respond in ways oriented to that research context. This does not resemble how media
15
16 is taken up in their everyday lives. For CDA, which tends to study more sensitive topics such as
17
18 racism, immigration or nationalism, it would be especially hard to carry out such decontextualized
19
20 audience research. Here online ethnographies have been shown to be one way to access this kind of
21
22 complexity (Pink, 2015). Such unobtrusive methods, it is argued, offer a way to find out what people
23
24 say about the media when they are not consciously 'talking about the media' in a performative way,
25
26 as they are when a media studies researcher interviews them (boyd, 2008).
27
28

29
30 In media studies, it has, for example, become commonplace to study television audiences through
31
32 online discussion forums to research how people evaluate characters and stories (Bury, 2008). Hine
33
34 (2008) looked at how audiences discussed television programs online, which has received harsh
35
36 criticism by academics. Audiences expressed appreciation of the program but were also critical, and
37
38 appeared highly aware of television conventions and how certain issues may be glossed over or
39
40 shaped for the purposes of entertainment.
41

42
43 Taking on this kind of reception research in CDA, it could be argued, could be one way to address the
44
45 problem of the critical analyst providing the single and authoritative reading. In the broader field of
46
47 Critical Discourse Studies there has also been work, for example, on the way in which social media
48
49 provides sites of alternative political views on things like racism, where mainstream new media tend
50
51 to remain highly focused only on elite persons and officials (Van Zoonen, 2007). In CDA, some
52
53 scholars have begun to explore the way that social media can be researched for the kinds of
54
55
56
57
58
59
60

1
2
3 competing discourses that can be found around mainstream news media (Way, 2015). But as
4
5 regards news, and specifically in CDA itself, this is an area that still remains to be explored.
6

7
8 Media scholars also indicate that even if our research interest is in the former top-down forms of
9
10 media, such as broadcast news or television, it now also is a requirement to study this as part of the
11
12 way it is integrated with other media platforms. This is in regard to the manner in which content is
13
14 produced, how it is delivered and how it is consumed (Livingstone, 2004). Even formerly 'traditional'
15
16 forms of media are now produced as part of multimedia, multiplatform content. For example, reality
17
18 television shows are now created as a form of 'social television' (Selva, 2016: 161). These are built in
19
20 a way to link with and foster social media activity. Reality television participants may themselves
21
22 produce further self-promotional content through Twitter feeds designed to be picked up as news,
23
24 which is then fed out to users and appears in the news section of their social media platform.
25
26

27
28 It has been argued that it is these patterns of content production, of news and other programming,
29
30 and social media trending, which have reshaped public and civic debate (Van Dijck & Poell, 2015: 1).
31
32 Simply, if we want to understand the nature, not only of audience responses, but of news texts
33
34 themselves, they must be seen as part of these cycles of interconnected media.
35
36

37
38 This new media landscape has been referred to as a kind of 'event society' (Murthy, 2012) where
39
40 'events' is a term used to capture the way that social media tends to contain a constant stream of
41
42 passing, trivial events. These could be what Katz and Dayan (1985) would have called 'pseudo
43
44 events'. Such events are the comments of a reality show participant, generic news stories with click
45
46 bait captions such as 'do we really need to sleep', comments on your evening meal, a picture of your
47
48 dog, the consumption of goods. The 'scan and go' clicktivism culture of social media described by
49
50 Dean (2010) accounts then for the way that users engage with this stream of events and that they
51
52 too 'interact' using the affordances of social media platforms to express 'like' or to tweet 'love heart'
53
54 icons as a signal of political support.
55
56
57
58
59
60

1
2
3 The nature of this landscape challenges CDA to consider which texts provide the most suitable kinds
4
5 of data. In a top-down media environment, the study of elite texts would appear logical in looking
6
7 for the ideology of the powerful. But in the social media landscape, we might argue, one important
8
9 site of study is the configurations formed by these apparently trivial texts.
10

11 **Multimodal communication**

12
13
14 The kinds of shifts in communication we have looked at so far, the increased need to engage readers,
15
16 the need to carry out research across interlocking platforms, provides another important challenge
17
18 for CDA: discourses must be studied at a multimodal level. Van Leeuwen (2015) argues that there
19
20 has been an 'aestheticization' of communication. This has its origins in advertising, where product
21
22 marketing involves using attractive people, setting, and overall appealing designs. But this is now
23
24 found across documents, texts, objects and media that were formerly highly functional (Machin &
25
26 Van Leeuwen, 2016). So too, media such as news outlets present content in newly aestheticized
27
28 ways. And these aestheticized forms deploy design features as part of the ways in which they
29
30 communicate discourses to audiences, as part of how they engage with them. Much time and
31
32 resources go into the presentation of news in ways that integrates it with other kinds of content
33
34 (Machin & Polzer, 2015). And as these authors argue, such multimodal communication should not be
35
36 viewed simply as dressing or style, but as part of the meanings communicated by content. And if we
37
38 want to understand these multimodal discourses and the ideologies they carry, CDA will have to
39
40 engage with these.
41
42
43
44
45

46 A multimodal level of analysis is also required at a different level. News found on web pages and
47
48 social media may carry less running text and more chunks of texts connected to images, bulleted
49
50 lists, graphics used to represent data in an accessible and fun way. In early 2017 Donald Trump
51
52 communicated about levels of crime amongst black people via Twitter through a kind of data table,
53
54 which also carried a cut-out of a black youth. This tweet generated responses in new outlets around
55
56 the world and across social media, which also took the form of data tables, each aestheticized in its
57
58
59
60

1
2
3 own way. CDA has always been interested in things like the representation of agency and causality.
4
5 But in these graphics, these things are communicated symbolically by graphic elements and by the
6
7 affordances of tables. CDA has begun to become more aware of the need to include multimodal data
8
9 as part of its analysis. But the social media landscape calls for this to be the basic point of departure.
10

11
12 Multimodal analysis is also required if we accept that one challenge is to shift away from analysis
13
14 based on single static texts, to those texts that form part of interlocking media, and platforms that
15
16 will contain different kinds of content. So, what tools of analysis are required to analyze the
17
18 discourses found across cycles of connected media, which include high levels of aestheticization,
19
20 embedded film clips, and various kinds of data? Such studies have appeared, for example, Zhang et
21
22 al (2015) looked at the way that a science news website presented science through discourses of
23
24 entertainment and curiosity, and addressed a particular kind of community. Here 'knowledge' itself
25
26 clearly becomes more about the kinds of processes of engagement and opinion we have discussed in
27
28 earlier sections of this paper. Such meanings were never clearly explained in language, but were
29
30 carried multimodally. Here language in texts could not be understood without the additional level of
31
32 attention to multimodal discourse.
33
34

35 36 **Conclusion: the specific challenges for CDA**

37
38
39 CDA, we believe, offers an excellent way to identify what Van Dijk (1993) called the manipulation
40
41 going on in texts. But it is clear that lack of academic engagement with context, i.e. how texts get
42
43 produced and read, can lead to a rather simplistic level of analysis. This in itself can serve to weaken
44
45 any project that seeks to identify and challenge dominant ideology in society, and the inequalities
46
47 that it sustains in its own interest. In this sense, engaging with texts as they are part of the social
48
49 media landscape we have described in this paper, is a clear part of the requirement for CDA.
50
51

52
53 This engagement with texts as a part of social media means seeing them as part of a transformation,
54
55 not only of the media landscape but of our socio-political formation. Such texts represent
56
57 communication where there has been a massive decline of former powerful state institutions and
58
59
60

1
2
3 ratified knowledge, often established and naturalised over many centuries. Former centralized, top-
4
5 down media have been replaced by interlocking platforms that carry many genres of content, using
6
7 different media. And these will tend to be highly multimodal, using chunks of text, bullets, and lists
8
9 combined with images and data graphics. Discourse will be increasingly multimodal as
10
11 communication becomes more aestheticized, but sites of the dissemination of discourse can no
12
13 longer best be accounted for by analysis of language alone.
14

15
16 While CDA scholars knew that traditional news texts or broadcasts operated in a one way, top-down
17
18 fashion as regards how they disseminated discourses, we must now ask what kinds of flows are
19
20 fostered and prevented in the configurations that are now emerging? What kinds of acceptance and
21
22 resistance to these discourses are emerging? And clearly in this context, we may have opportunities
23
24 to look at competing discourses on interlocking social media platforms that often, of course, feed
25
26 into traditional media.
27

28
29 Finally, what kinds of elite interests are being served in this new socio-political formation? It has
30
31 been argued that the very nature of neoliberal society is that all things are ruled by market logic
32
33 (Jessop, 2007). Everything you know and do will be incorporated into this project. Of course,
34
35 therefore, the elite remains the same. They are those whose interests are served by capitalist
36
37 accumulation. But it has been argued that this market ideology now permeates all things. It
38
39 becomes the discourses by which we manage our work, education, leisure time, education and
40
41 domestic life. And social media appears to be playing a key role in this process.
42
43
44

45
46 Cauldry (2012) offered the term 'media practices' to think about the way that media become
47
48 incorporated in our lives in mundane ways. For example, how 'searching online', 'latest update',
49
50 'sharing', 'community', 'liking', 'friending', 'most popular' may come to shape how we do, and think
51
52 about, routine things, such as our relationships with other people and wider social relations. For
53
54 Hjelmslev (1963), both discourses and the substances and forms used to communicate them, in other
55
56
57
58
59
60

1
2
3 words the materials and technologies of communication, are one and the same as our consciousness.
4
5 As these change, so must the focus, tools and basic assumptions of CDA.
